

Atos

# Angular Module 6 - Routing

Peter Kassenaar – info@kassenaar.com

**WORLDWIDE LOCATIONS** 

# Routing architecture and goal

- Make use of SPA principle
- Making deep links possible

#### Angular 1: ng-route, of ui-router

1. <script src="js/vendor/angular/angular-route.min.js"></script>
2. <div ng-view></div>
3. var app = angular.module('myApp', ['ngRoute']);

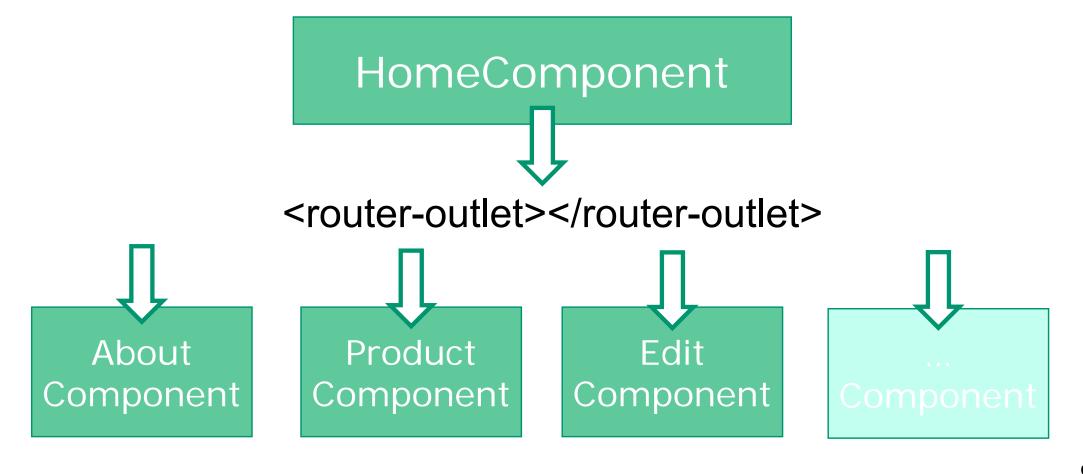

Daarna \$routeProvider configureren (of \$stateProvider bij ui-router)

# **Angular 2: Component Router**

- Niet beschikbaar voor AngularJS 1.4+
- Niet veel gebruikt: ui-router

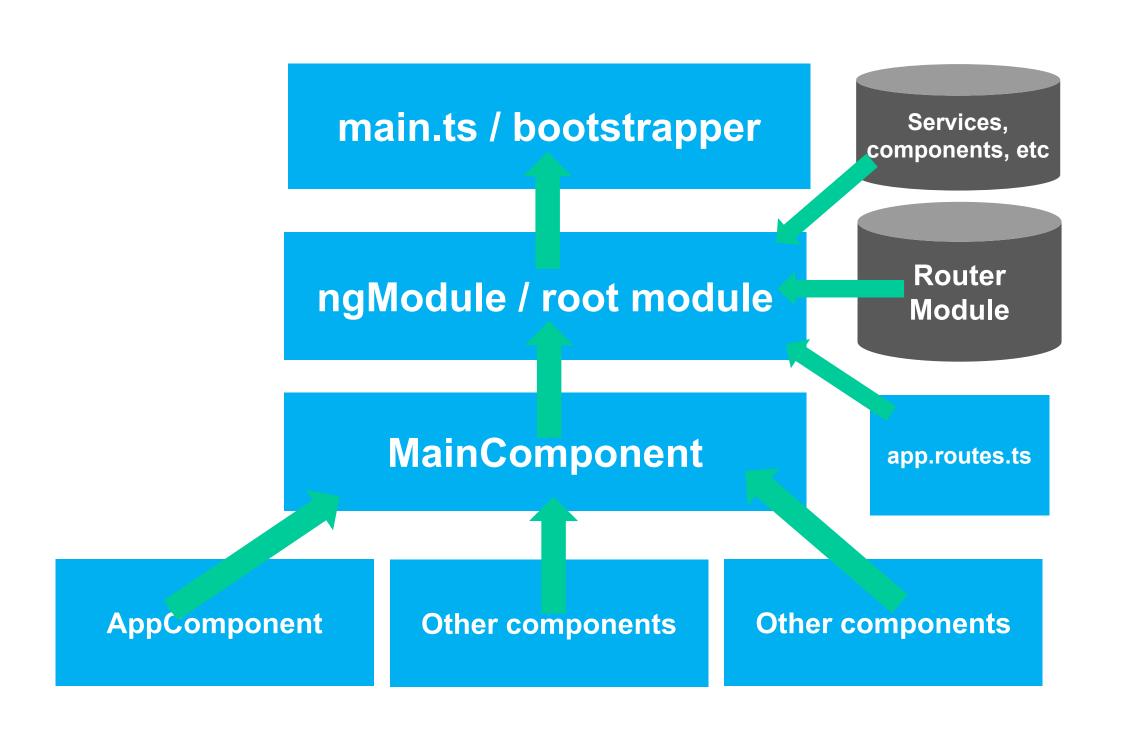

## Routing – every route is a Component

- HomeComponent (or: RootComponent, whatever) with main menu
- Components are injected in <router-outlet></router-outlet>

# Routing met Angular CLI

- Standaard: géén routing in CLI-project
- Routing vanaf het begin toevoegen?
  - ng new myProject --routing
  - OF: vraag in CLI-command prompt met Yes beantwoorden
- Dit maakt app.routing.module in het project
- (iets) anders van opbouw dan we hier presenteren

## Stappenplan routing

1.Base Href toevoegen in header van index.html (!)

- Er kunnen meerdere routes per module zijn. Elke component kan zijn eigen ChildRoutes definiëren – volgt later.
- Angular-CLI doet dit automatisch voor je.

2. Routes toevoegen. Convention: app.routes.ts.

```
// app.routes.ts
import {Routes} from '@angular/router';
import {AppComponent} from "./app.component";
import {CityAddComponent} from "./city.add.component";
export const AppRoutes: Routes = [
   {path: '', component: AppComponent},
   {path: 'home', component: AppComponent},
   {path: 'add', component: CityAddComponent}
];
```

Er zijn meerdere opties en notatiewijzen om routes te declareren

#### 3. Routes beschikbaar maken in Module

- Import RouterModule in applicatie
- Import ./app.routes in applicatie

```
Import Router-
// Router
                                                         onderdelen
import {RouterModule} from '@angular/router';
import {AppRoutes} from './app.routes';
                                                            Nieuw!
// Components
                                                        MainComponent
                                                       gaan we nog maken
import {MainComponent} from './MainComponent';
@NgModule({
   imports
                                                     Configure
      BrowserModule, HttpModule,
                                               RouterModule.forRoot()
      RouterModule.forRoot(AppRoutes)
   declarations: [
      MainComponent,
      AppComponent,
      CityAddComponent
                                           MainComponent wordt nu
                                                gebootstrapt
   bootstrap : [MainComponent]
})
export class AppModule {
```

## 4. MainComponent met Routing maken

Nieuwe component met hoofdmenu en <router-outlet>

```
import {Component, OnInit} from '@angular/core';
                                                                             "Hoofdmenu". Let op
@Component({
                                                                                  routerLink
   selector: 'main-component',
   template:
      <h1>Pick your favorite city</h1>
      <!-- Static 'main menu'. Always visible-->
      <!-- Add routerLink directive. Angular replaces this with correct <a href="..."> -->
      <a routerLink="/home" class="btn btn-primary">List of cities</a>
      <a routerLink="/add" class="btn btn-primary">Add City</a>
      <hr>>
      <!-- Dynamically inject views here -->
      <router-outlet></router-outlet>
      <!-- Static footer here. Always visible-->
                                                                           <router-outlet>
})
export class MainComponent implements OnInit {
   constructor() {
   ngOnInit() { }
}
                                 Lege Component
```

#### 5. Eventueel: index.html aanpassen

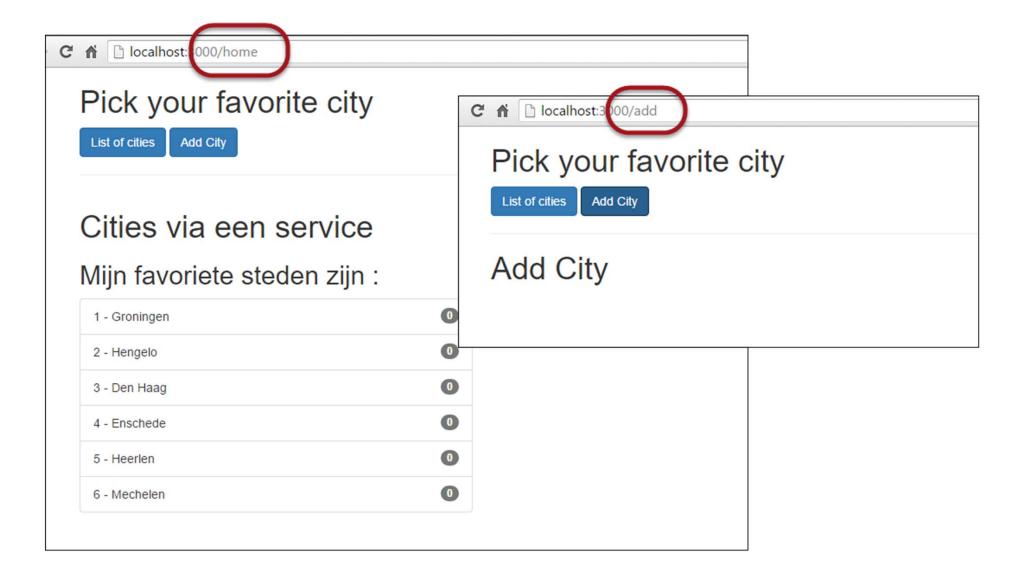

- Eventueel selector in index.html aanpassen
- Als MainComponent een andere selector heeft

#### 6. Nieuwe component (en) maken en importeren

#### Elke component is een route

```
// city.add.component.ts
import { Component } from 'angular2/core';
               // city.edit.component.ts
@Component({
               import { Component } from 'angular2/core'.
   selector:
                                      // city.detail.component.ts
   template:
                                      import { Component } from 'angular2/core';
               @Component({
})
                  selector: 'edit-ci
                                      @Component({
                  template: `<h1>Edi
export class C:
                                         selector: 'detail-city',
               })
                                         template: `<h1>Detail City</h1> ...`
}
               export class CityEdit()
                                      export class CityDetailComponent{
```

## 7. Run the application

#### Catch-all routes

```
export const AppRoutes: Routes = [
           {path: '', component: AppComponent},
           {path: 'home', component: AppComponent},
           {path: 'add', component: CityAddComponent},
 9
10
               // catch all route
11
               path : '**',
12
               redirectTo: 'home'
13
14
15
       ];
16
```

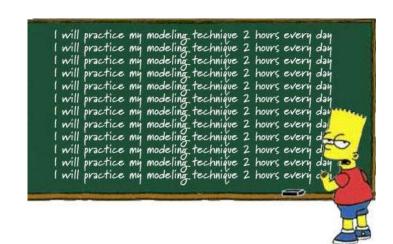

#### Gebruik \*\* voor een catch-all route:

- Component opgeven (=route blijft zichtbaar in URL-balk
- redirectTo: opgeven (=nieuwe route staat in URLbalk)

#### Checkpoint

- Routes worden op module-level ingesteld (Angular 1: app-level).
- Volg het stappenplan. Denk aan injecteren van RouterModule,
   app.routes.ts en <base href="/"> in de HTML
- Voorbeeld: /400-routing
- Voeg een nieuwe component to aan het routing-voorbeeld en zorg dat naar deze component kan worden gerouteerd
- Oefening 7a) en 7b) (=nieuwe app maken, inclusief --routing)

# Oefening....

# Routeparameters

Master-Detail views en -applications

#### Dynamische routes maken

Doel: Enkele detailpagina voor klanten, producten, diensten, etc.

Leesbare routes als: /cities/5, of products/philips/broodrooster, enzovoort

#### Werkwijze:

- 1. Aanpassen app.routes.ts en hyperlinks in de pagina.
- 2. Gebruik route: Activated Route in de detail component
- 3. Schrijf hyperlinks als <a [routerLink]=...> met parameter

#### 1. app.routes.ts aanpassen

```
// app.routes.ts
import {Routes} from '@angular/router';
import {AppComponent} from "./app.component";
import {CityAddComponent} from "./city.add.component";
import {CityDetailComponent} from "./city.detail.component";
export const AppRoutes: Routes = [
   {path: '', component: AppComponent},
   {path: 'home', component: AppComponent},
   {path: 'add', component: CityAddComponent},
   {path: 'detail/:id', component: CityDetailComponent}
];
```

#### 2. Detail Component maken

```
// city.detail.component.ts
// import {RouteParams} from "@angular/router"; // OLD way
import {ActivatedRoute} from '@angular/router';
@Component({
   selector: 'city-detail',
                                                                        ActivatedRoute
   template: `<h1>City Detail</h1>
   <h2>Details voor city: {{ id }}</h2>
})
export class CityDetailComponent implements OnInit, OnDestra
   id: string;
   currentCity: City;
   constructor(private route: ActivatedRoute) {
   ngOnInit() {
      this.route.params
         .subscribe((id: any) => {
            this.id = id;
         });
```

#### 2a. DetailComponent - variants

## Using router snapshots

```
// OR:
// Work via Router-snapshot:
// Sometimes we're not interested in future changes of a route parameter.
// All we need the id and once we have it, we can provide the data we want to provide.
// In this case, an Observable can bit a bit of an overkill.
// A *snapshot* is simply a snapshot representation of the activated route.
this.id = this.route.snapshot.params['id'];
this.name = this.route.snapshot.params['name'];
```

#### 2b. DetailComponent - variants

```
ngOnInit() {
   // NEW:
   this.sub = this.route.params
      .subscribe((params: any) => {
         this.id = params['id'];
         this.name = params['name'];
      });
                                                                         .unsubscribe()
ngOnDestroy() {
   // If subscribed, we must unsubscribe before Angular destroys the component.
   // Failure to do so could create a memory leak.
   this.sub.unsubscribe();
```

#### 3. Detail component toevoegen aan Module

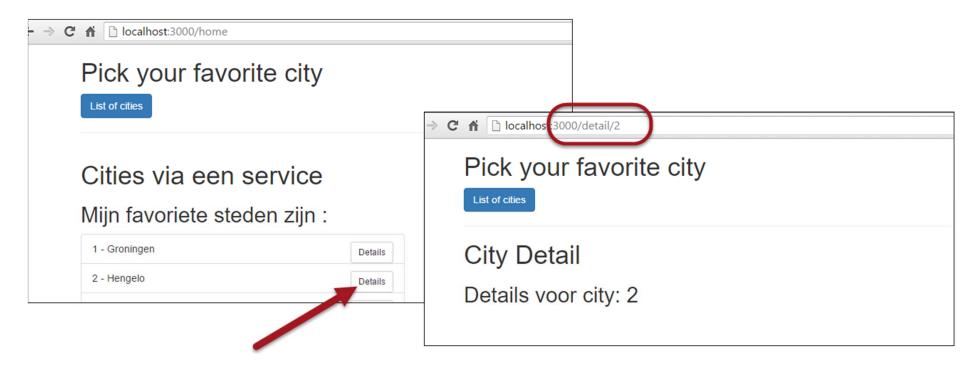

```
// app.module.ts
// Components
import {CityDetailComponent} from './city.detail.component';
@NgModule({
   imports
                                                                      Component
   declarations: [
      CityDetailComponent
   providers : [CityService],
   bootstrap : [MainComponent]
})
export class AppModule {
```

## 3. App Component ('Master View') aanpassen

Let er op dat [routerLink] nu dynamisch moet worden gevuld en dus binnen [...] moet staan voor attribute binding

#### Meegeven van parameters

- Let op meegeven van array van parameters aan [routerLink]
- Parameters worden gematched op positie. Niet op naam.
- Optioneel : service uitbreiden om specifiek product/item te retourneren

#### Optionele parameters : [queryParams]

#### In de HTML

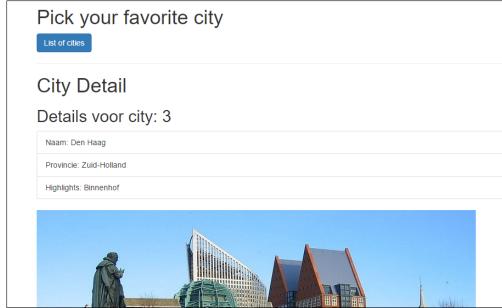

```
<a [routerLink]="['/detail', city.id, city.name]"
  [queryParams]="{province:city.province, population:180000}">
     {{ city.id}} - {{ city.name }}
</a>
```

#### In de class

```
this.route.queryParams.subscribe((params: any) => {
    this.province = params.province;
})
```

#### Vervolg – details via Service

Uncomment de regels die te maken hebben met cityService:

#### In city.service.ts:

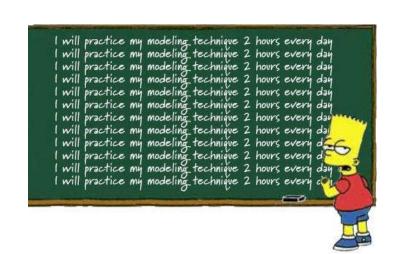

Bijvoorbeeld (kan beter, maar het werkt wel):

```
// retourneer een city, op basis van ID
getCity(id: string): City[] {
   return this._http.get('app/cities.json')
      .map(cities =>cities.json())
      .map(cities => cities.filter((city: City) => {
       return city.id === parseInt(id);
      }))
}
```

#### Checkpoint

- RouteParameters worden met :parameterName ingesteld in app.routes.ts.
- Denk aan injection van ActivatedRoute in de component.
- Hierin is een property .params aanwezig met de meegegeven parameters.
- <a [routerLink] = "..." > gaan uitbreiden
- Voorbeeld: \401-router-parameter
- Oefening: 7c)
